## Waste Management Solutions for Business

The core of WorkWaste's business philosophy is to seek the most sustainable waste management strategy for the job at hand. We're always looking for a better, more cost-effective solution to benefit your business's bottom line. We monitor the pulse of the waste world daily and recognize trends and new opportunities for our customers.

### For Metal Finishers

There are several types of wastes that metal finishers are required to manage - acids, masking waste, plating sludges, heavy metal solutions, spent solvents, and more. Then there is the burden of identifying the best management practices for each waste and keeping your profiles updated and generation rates as low as possible. We take pride in assisting our customers to reduce their waste generation volume and cost. We do not deflect you a website or tell you to call "customer service" when you need something - we work with each customer personally to make sure your waste gets picked up on time and at the right price.

**WorkWaste manages the following waste streams for metal platers and finishers:**

- F Listed Plating Sludge
- Acids
- Solvent Rags
- Electroless Process Waste
- Bulk Liquids
- Cyanide Bearing Wastes
- Masking Waste
- Chrome Waste
- Other Process Waste
